PROFILE

Manual QA Engineer specializing in API Testing, advancing into Automation (Java/Selenium) — 320+ test scenarios designed, 20+ defects isolated, ISTQB-certified (100/100). I approach applications as interconnected systems: when I found a security cross-flow vulnerability by testing Forgot Password against real flight-schedule data, it wasn't luck — it's how I think. 8+ years of high-pressure, real-time triage in telecommunications trained that instinct long before I called it QA. Open to remote Manual QA Engineer roles worldwide — CET/EU-overlapping hours (Tbilisi, GMT+4).

WORK EXPERIENCE

02/2026 – Present
Remote

QA Intern - Manual & API Testing, ODIN P2P Mobile App

- Designed 320+ test scenarios and executed 50+ structured test cases across 13 feature modules — covering authentication, order lifecycle, payment, and notification flows, based on requirements and user stories.
- Executed functional, regression, smoke, and exploratory testing across 2 build cycles per week; managed full defect lifecycle in Jira — from root cause analysis and severity classification (Critical/High/Medium) through fix verification.
- Validated REST API behavior using Postman across authentication, order, and payment endpoints — checking JSON response structure and HTTP status codes against expected outcomes for each user flow.
- Performed UI testing across Android devices (Realme 10, Honor X8d, Samsung Galaxy Tab A7) — identified Critical/High defects including a Time Picker crash, a security cross-flow vulnerability in password validation, and a notification timing inconsistency, isolated through hypothesis-based testing using real flight data across two routes with significantly different durations.

2018 – Present
Remote

Universal Hotline Operator, Magticom

- Handle 60–70 inbound technical requests daily across mobile, ISP, and order management services — applying structured triage, issue documentation, and escalation protocols to L2/L3 support teams
- Served as internal tester during B2B CRM and enterprise call-handling system migration (2021) — conducted functional, performance, and load testing on live workflows, ensuring zero critical disruption to customer facing operations.

EDUCATION & COURSES

03/2026 – Present

QA Automation Course — Java/Selenium/BDD Track, Quality Academy

02/2026 – 02/2026

API Testing — Postman & REST APIs, Quality Academy

10/2025 – 01/2026

Manual Software Testing — ISTQB-based, Quality Academy

2002 – 2006

Bachelor's Degree - Humanities, Ivane Javakishvili Tbilisi State University (TSU)

SKILLS & TOOLS

Testing & QA

Functional · Regression · Smoke · Exploratory Testing · Defect Lifecycle Management · API Testing · Cross-browser Testing · BDD (Cucumber) · AI-assisted testing (Claude/LLMs)

Test Design

EP · BVA · Decision Tables · Checklists · Test Cases based on User Stories

UI & API Testing

Postman (Collections, Environments, Assertions) · Swagger · REST / HTTP · JSON · DevTools (Network tab)

Bug & Test Management

Jira · Linear · TestCaseLab · TestRail (familiar) · ClickUp · Trello

Automation (in progress)

Java (fundamentals) · Selenium WebDriver · Git · IntelliJ IDEA · GitHub · RestAssured (learning)

Methodologies

Agile / Scrum · SDLC · STLC · ISTQB principles · BDD

Technical Basics

SQL — SELECT, WHERE, JOIN · HTML/CSS (basic)

LANGUAGES

Georgian

- Native

Russian — Conversational

- B2

English

- Speaking B2
- Reading/Listening C1

PROJECTS

06/2026 – 07/2026

Pro Bono QA Testing — Donation Platform, autism.ge (NGO)

- Conducted risk-based UAT on a live donation platform, prioritizing authentication and payment flows across the full user journey
- Identified 14 defects (4 Critical), including a payment-flow error masking successful transactions — documented with reproduction steps and video evidence

01/2026 – 01/2026

Manual QA Tester — Web Application Testing, GPI Holding, Insurance Domain

- Designed and executed end-to-end test coverage for a web-based insurance platform — applied Equivalence Partitioning, Boundary Value Analysis, and Decision Tables to validate complex actuarial business rules across age, period, and premium calculation flows; performed cross-browser testing (Chrome, Firefox, Edge)
- Identified two high-impact defects: a critical data privacy vulnerability — system exposed and auto-populated a stranger's personal data upon entry of an invalid ID, violating data protection principles — and a BVA edge case where the system accepted a 366-day travel period for a non-leap year, bypassing core business validation logic
